Three comparisons are useful. First, the distance must be sufficiently large.
We retain $R \geq \lambda$ as a useful reference for sizing the experiment.
This neighbouring line must remain completely free of yellow highlighting.

Consecutive math line with $R \geq \lambda$ and ordinary prose.
Another selected line with $R \geq 2D^2/\lambda$ and a raised exponent.
An unselected line beneath the two formulas.

Left column with ordinary text and accents:
café, naïve.
An inline formula $x_i^2 \geq y_j$ sits in this selected line.
The next line in the left column is not selected.

Right column with a larger font size.
A second line in the right column.
A third line in the right column.

Small text above a larger line.
Larger selected text with ascenders and descenders.
Small text below a larger line.

A displayed formula keeps its fraction and limits:

$$\sum_{i=1}^{n} \frac{x_i^2}{1+\lambda_i} = \int_0^1 f(t)\,dt.$$
